Pointer Arithmetic

- Ability to modify a pointer's target address with arithmetic operation
- Adding or subtracting from a pointer moves it by a multiple of the size of the datatype it points to. For example, adding 1 to a pointer to 4-byte integer values will increment the pointer by 4 bytes.

- Pointer arithmetic cannot be performed on void pointers
- Use case in this presentation: **pointers and arrays**

Pointer Arithmetic and Array

The concept of an array and of a pointer is the same:

- Identifier of an array is equivalent to the address of its first element
- A pointer is equivalent to the address of the first element that it points to

```
int array[5];  
int *pointer;
```

An array automatically allocates memory if it's initialized

```
//declaration  
int array[5];  
  
//initialization  
int array[] = {1,2,3,4,5};
```

Assignment operation:

```
pointer = array;
```

- pointer and array are equivalent and have the same properties
- **But:**
value of pointer is changeable → **ordinary pointer**
array will always point to first element of its type → **constant pointer**

array
pointer;

Pointer Arithmetic and Array

Array Indexing

- C++ doesn't really understand array indexing, except in declarations
- The compiler converts the array into a pointer

```
array[n] == *(array + n)
```

Reason why an array element count from zero

- Commutative law:

```
array[n] == *(array + n)
```

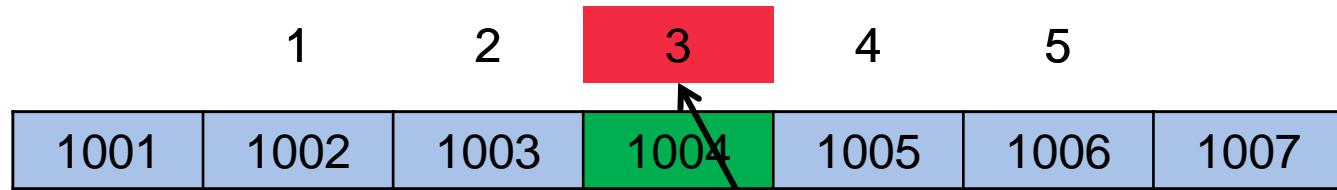

```
array + n == n + array
```

```
array[n] == n[array]
```

Pointer Arithmetic and Array

How Pointer Arithmetic works:

```
char array[ ] = {1, 2, 3, 4, 5}
```

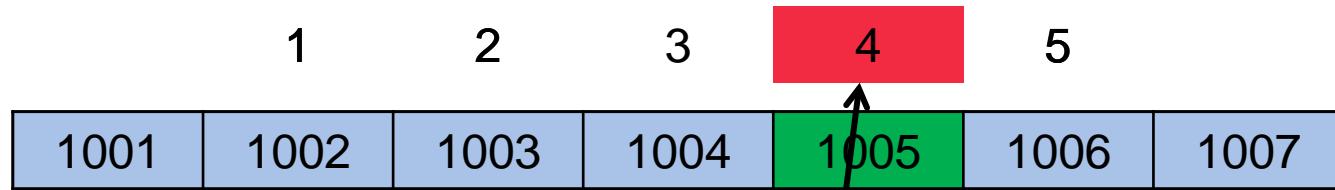

```
&(array[2])
```

```
*(&(array[2]))
```

Pointer Arithmetic and Array

How Pointer Arithmetic works:

```
char array[ ] = {1, 2, 3, 4, 5}
```

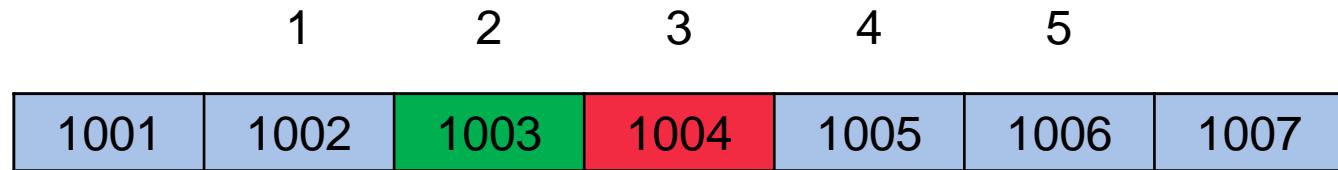

```
&(array[ 2 ]) +1
```

```
*(&(array[ 2 ]) +1)
```

Pointer Arithmetic and Array

How Pointer Arithmetic works:

```
char array[ ] = {1, 2, 3, 4, 5}
```

```
char* p1 = &(array[1])
```

```
char* p2 = &(array[2])
```

$*p1 + *p2 \rightarrow 5$

$*p2 - *p1 \rightarrow 1$

Pointer Arithmetic and Array - Example

```
int array[ ]={0,0,0,0};  
int *pointer;  
  
pointer = &(array[2]);  
*pointer = 3;  
pointer++;  
*pointer = 9;  
pointer = pointer - 3;  
*pointer = 6;  
*(pointer+2) = 7;
```

Name	Type	Value
array[0]	int	0
array[1]	int	0
array[2]	int	0
array[3]	int	0
pointer	int*	
*pointer	int	

Pointer Arithmetic and Array - Example

```
int array[ ]={ 0 , 0 , 0 , 0 } ;  
int *pointer;  
  
pointer = &(array[ 2 ]) ;
```

Name	Type	Value
array[0]	int	0
array[1]	int	0
array[2]	int	0
array[3]	int	0
pointer	int*	address to array[2]
*pointer	int	

Pointer Arithmetic and Array - Example

```
int array[ ]={ 0 , 0 , 0 , 0 } ;  
int *pointer;  
  
pointer = &(array[ 2 ]) ;  
*pointer = 3 ;
```

Name	Type	Value
array[0]	int	0
array[1]	int	0
array[2]	int	3
array[3]	int	0
pointer	int*	address to array[2]
*pointer	int	3

Pointer Arithmetic and Array - Example

```
int array[ ]={0,0,0,0};  
int *pointer;  
  
pointer = &(array[2]);  
*pointer = 3;  
pointer++;
```

Name	Type	Value
array[0]	int	0
array[1]	int	0
array[2]	int	3
array[3]	int	0
pointer	int*	address to array[3]
*pointer	int	

Pointer Arithmetic and Array - Example

```
int array[ ]={ 0 , 0 , 0 , 0 } ;  
int *pointer;  
  
pointer = &(array[ 2 ]) ;  
*pointer = 3 ;  
pointer++ ;  
*pointer = 9 ;
```

Name	Type	Value
array[0]	int	0
array[1]	int	0
array[2]	int	3
array[3]	int	9
pointer	int*	address to array[3]
*pointer	int	9

Pointer Arithmetic and Array - Example

```
int array[ ]={0,0,0,0};  
int *pointer;  
  
pointer = &(array[2]);  
*pointer = 3;  
pointer++;  
*pointer = 9;  
pointer = pointer - 3;
```

Name	Type	Value
array[0]	int	0
array[1]	int	0
array[2]	int	3
array[3]	int	9
pointer	int*	address to array[0]
*pointer	int	

Pointer Arithmetic and Array - Example

```
int array[ ]={0,0,0,0};  
int *pointer;  
  
pointer = &(array[2]);  
*pointer = 3;  
pointer++;  
*pointer = 9;  
pointer = pointer - 3;  
*pointer = 6;
```

Name	Type	Value
array[0]	int	6
array[1]	int	0
array[2]	int	3
array[3]	int	9
pointer	int*	address to array[0]
*pointer	int	6

Pointer Arithmetic and Array - Example

```
int array[ ]={0,0,0,0};  
int *pointer;  
  
pointer = &(array[2]);  
*pointer = 3;  
pointer++;  
*pointer = 9;  
pointer = pointer - 3;  
*pointer = 6;  
*(pointer+2) = 7;
```

Name	Type	Value
array[0]	int	6
array[1]	int	0
array[2]	int	7
array[3]	int	9
pointer	int*	address to array[2]
*pointer	int	7

Pointer Arithmetic and Array - Example

```
int array[ ]={0,0,0,0};  
int *pointer;  
  
pointer = &(array[2]);  
*pointer = 3;  
pointer++;  
*pointer = 9;  
pointer = pointer - 3;  
*pointer = 6;  
pointer = pointer + 2;  
*pointer = 7;
```

Name	Type	Value
array[0]	int	6
array[1]	int	0
array[2]	int	7
array[3]	int	9
pointer	int*	address [2]
*pointer	int	6, 0, 1, 9

array = {6, 0, 1, 9}
