

STL: Erase-remove idiom

Motivation

- **Container / Collection**
- remove all elements that have a certain value or fulfill a certain criterion
- std::algorithm provides two methods
 - remove
 - remove_if
- their names are confusing

Definition

Method provides “remove” functionality for STL Containers

```
#include <algorithm>
std::remove (begin, end, value);
```

- Cplusplus.com:
Remove value from range
- Transforms the range [first,last) into a range with all the elements that compare equal to value removed
- returns an iterator to the new end of that range.

Remove?

Definition

```
template <class ForwardIterator, class T>
    ForwardIterator remove (ForwardIterator first,
ForwardIterator last, const T& val)
{
    ForwardIterator result = first;
    while (first!=last) {
        if (!(*first == val)) {
            *result = *first;
            ++result;
        }
        ++first;
    }
    return result;
}
```

Example

std::remove doesn't "really" remove elements from a container

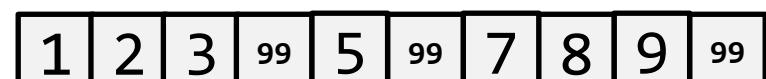

```
std::vector<int> v;  
for(int i=1; i<=10; ++i) {  
    v.push_back(i);  
}
```

10

```
std::cout << v.size();
```

v[3] = v[5] = v[9] = 99;

10

```
std::remove(v.begin(), v.end(), 99);
```

```
std::cout << v.size();
```

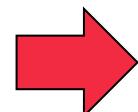

Example

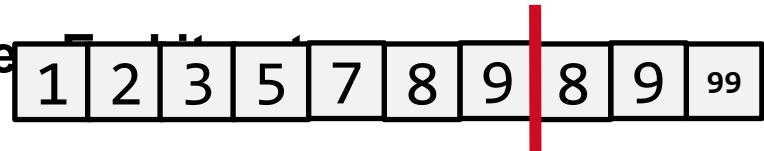

↑
v.begin()

newEnd
↑
v.end()

```
vector<int>::iterator newEnd =  
remove(v.begin(), v.end(), 99)
```

use std::erase with newEnd

Erase

Eliminate remaining elements

```
vector<int>::iterator newEnd =  
remove(v.begin(), v.end(), 99);
```

```
v.erase(newEnd, v.end());
```

std::remove cannot eliminate elements

→ it's necessary to invoke a member function

Additional information

- std::list provides own remove method
 - Inconsistency in STL, but faster approach for lists
- std::unique works in the same way as remove
